

Lab assignment 7

Q1. Create a binary tree shown as below. Traverse the tree in and display the information stored in the nodes.

Q2.

- Traverse the tree created in question 1 in in-order and print the information stored in the nodes.
- Traverse it in pre-order and print the information stored in the nodes.
- Traverse it in post-order and print the information stored in the nodes.

Q3. Write a program to generate an expression tree from a postfix expression

Q4. Write a program to evaluate a postfix expression

Q5. Define functions to implement the following operations for a binary search tree:

- Insert element
- traverse in in-order
- search an item
- delete an item

The main part of the code is given below:

```
if __name__ == "__main__":  
    root = None  
  
    keys = [20, 8, 22, 4, 12, 10, 14]  
  
    for key in keys:  
        root = insert(root, key)
```

```
print("Inorder traversal of the binary tree is:")
```

```
inorder(root)
```

```
print()
```

```
search(root,222)
```

```
search(root,22)
```

```
remove(root,4)
```

```
inorder(root)
```
