

Lab 8

Q1. Create a minheap with the following inputs.

30,25,24,23,16,15,13,12,7,5,4,3

Q2. Delete the node with the value 7

Q3. Perform heap sort on the list given in Q1.

Q4. Create a hash table with the following keys:

1,2,4,5,12,22,32

Hash table size is 10. Perform linear probing if collision occurs.

Q5. Create a hash table with the following keys:

1,2,4,5,12,22,32

Hash table size is 10. Perform quadratic probing to handle collision.

Q6. Create a hash table with the following keys:

1,2,4,5,12,22,32

Hash table size is 10. Perform double hashing to handle collision.

Q7. Create an adjacency matrix for the following graph. Define a function to perform BFS and another function to perform DFS.

Q8. Define a function to perform bubble sort

Q9. Define a function to perform selection sort

Q10. Define a function to find the kth smallest element in a list without performing sorting.

Q11. Define a function to perform quick sort
